Explanation of Columns

Verse: chapter and verse reference in John.

Reading: the text form found in Bezae.

Witnesses: selected early Christian writers and manuscripts that support Bezae. (The point is to partition Bezae's readings by layer, so readings not attested in Bezae are not included in the clusters.)

Fit: an indicator of how representative the reading is of its cluster. Higher values indicate a more central position in the cluster. This value is obtained from the "sil_width" column returned from the sil() function in R's "cluster" package.

Level: the level of the reading in the local genealogical stemma based on internal criteria. While the use of internal criteria is inherently subjective to a degree, the hope is that clear cases will outnumber ambiguous cases and provide a sense as to whether the layer could represent a specific historical influence that can be sequenced in relation to other layers.

(Note that the cluster numbers are assigned by the algorithm and have no apparent significance other than identification.)
